

San Francisco | March 4–8 | Moscone Center

SESSION ID: MBS-109

Better Securing the Now and the Next: Applying Engineering First Principles to Achieve Demonstrably Better Cybersecurity

Andy Bochman

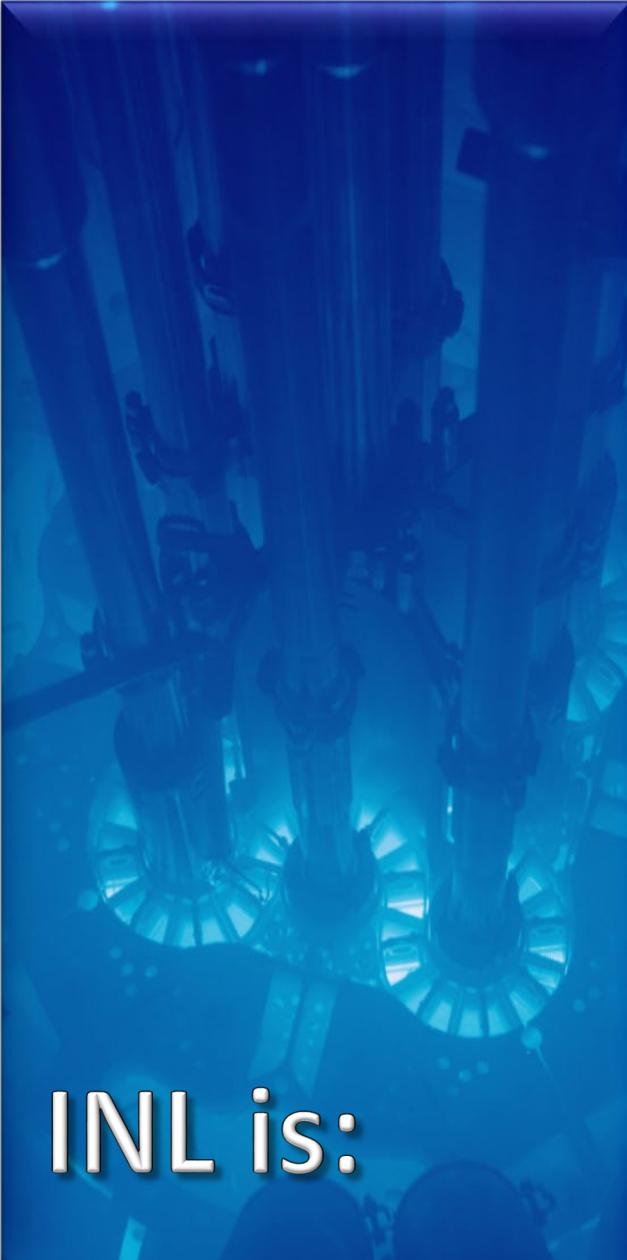

Senior Grid Strategist
Idaho National Lab
@andybochman

Virginia Wright

Energy Sector Portfolio Manager
Cybercore Integration Center
Idaho National Lab

#RSAC

INL is:

Nuclear Energy RD&D

Control Systems Cyber

Nuclear Energy Cyber

Grid Resilience

Evolution of Engineering

Engineering as a Bridge

Engineering is unique as a linking discipline:

- To the world of science
- To the world of technology and society
- As a source of innovation/economy

- Venkatesh “Venky” Narayananamurti,
Former Harvard Dean, School of
Engineering & Applied Sciences (SEAS),
<https://www.youtube.com/watch?v=L9DymHZH9cs>

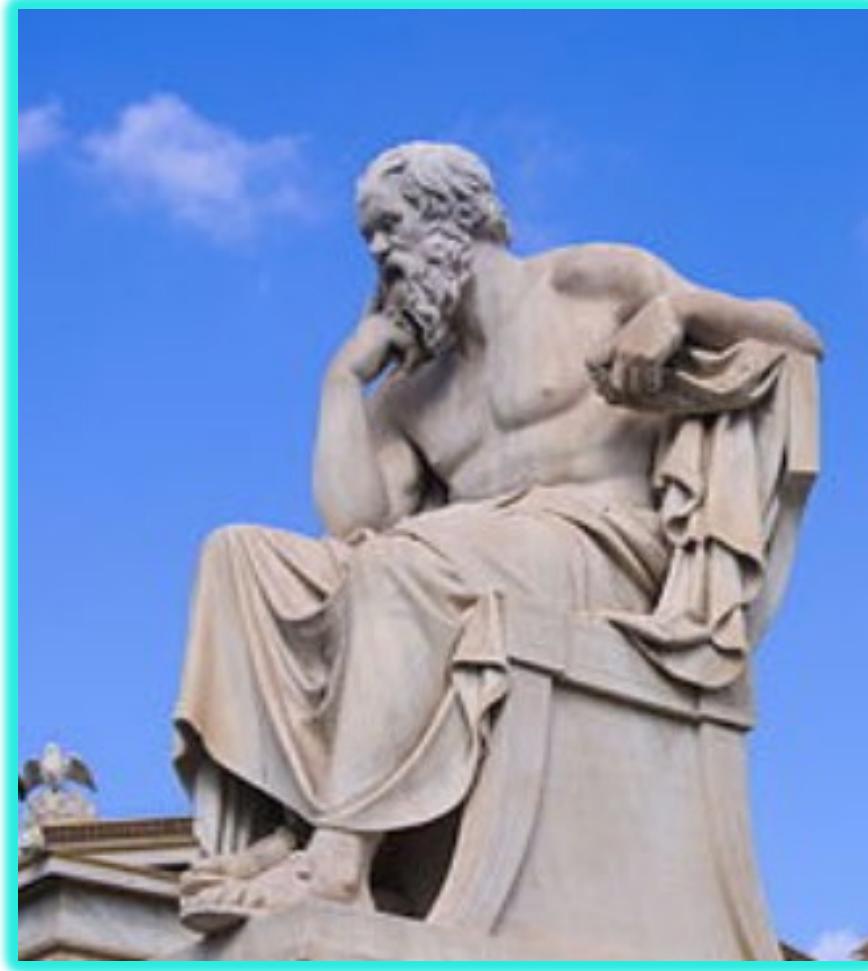

Why Cyber-Informed Engineering (CIE)?

- Because traditional engineering methods do not account for cyber risk
- And engineering curriculums do not include cyber
- And bolt-on IT security solutions do not work well for digital industrial control systems
- Sees potential to “engineer-out” many security risks

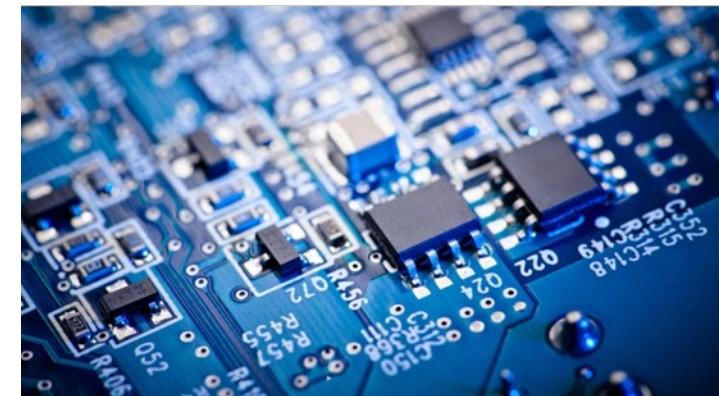

What is CIE?

- Definition: Including an awareness of cyber security challenges in the engineering process of digital and non-digital systems
- What is it?: A philosophy for characterizing the risks presented by digital technologies
- Objective: Promulgation of an updated engineering strategy, informed by an acute awareness of the cyber threats, with engineering-based methods for mitigating such risks

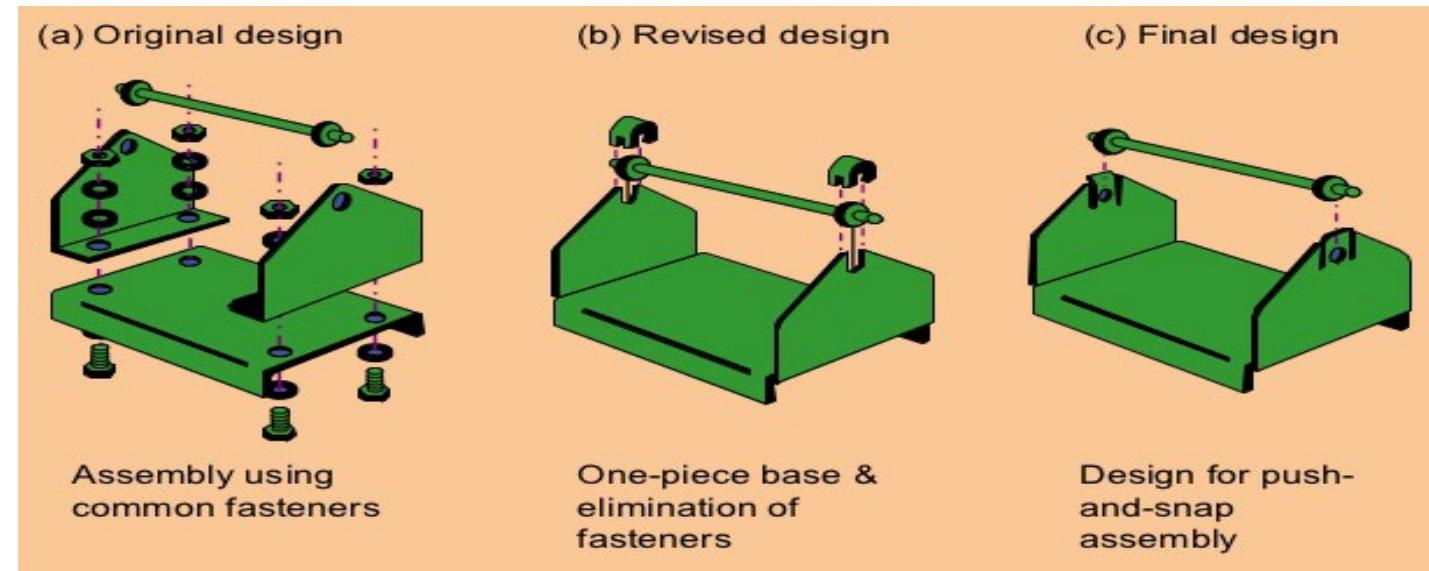

CIE: Framework Elements

- Consequence/Impact Analysis
- Systems Architecture
- Engineered Controls
- Design Simplification
- Resilience Planning
- Engineering Information Control
- Procurement and Contracting
- Interdependencies
- Cyber Security Culture
- Digital Asset Inventory
- Active Process Defense

Applied CIE Example: Design Simplification

- Reduce design to minimum necessary
- Be aware of latent functionality
- Consider non-digital technology where it fits
- Use ALARA (As Low as Reasonably Achievable) as a metaphor

How to Begin to Apply CIE Concepts

- Sooner:
 - Contact INL for a specific briefing
 - Grab the Cyber-informed Engineering technical report:
<https://www.osti.gov/biblio/1369373-cyber-informed-engineering>
 - Begin to socialize with engineers/operators and cyber security specialists planning projects
- Later:
 - If interested, contact INL for help inculcating into ongoing projects
 - Be on the lookout for future research enriching CIE to apply to new technology development and to provide richer tools to implementers

1st Harvest: Consequence-driven Cyber-informed Engineering (CCE)

- Acknowledges breaches ongoing at critical infrastructure orgs
- Admits even the best cyber hygiene doesn't stop certain adversaries
- Posits engineering solutions to block or limit the consequences of attackers' best efforts

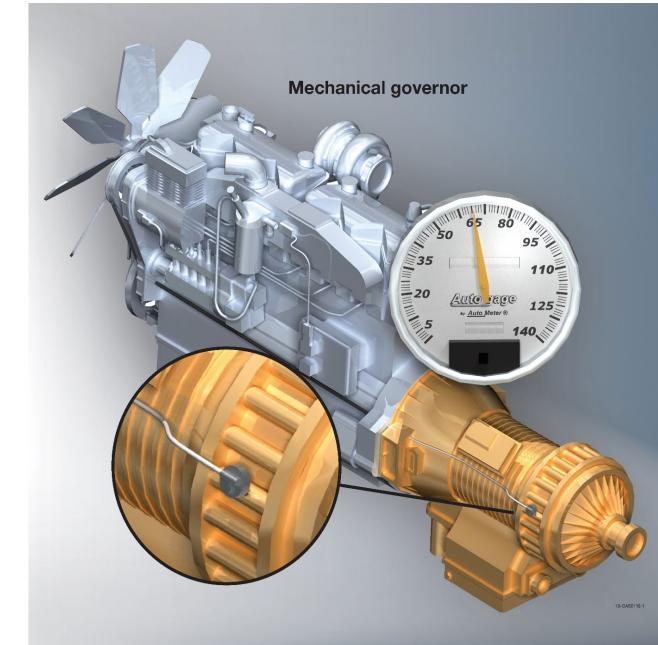

Seeks to change how organizations understand and manage their strategic cyber risks

Introducing the CCE Methodology

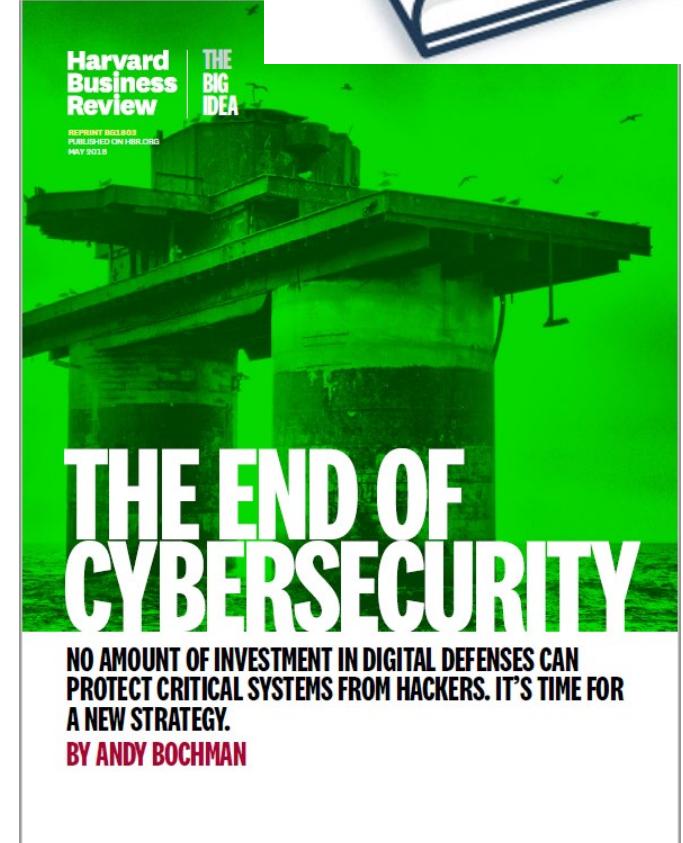

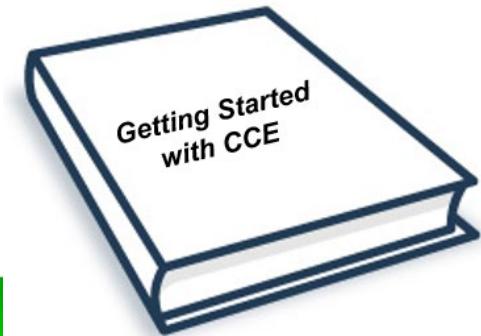

Step 1	Step 2	Step 3	Step 4
<p>Consequence Prioritization</p> <p>The diagram illustrates the calculation of the HCE Score. At the center is a large teal circle labeled "HCE Score". Eight smaller teal circles branch out from it, each representing a different factor: "Area Impacted", "Cost for recovery", "Public Safety", "System Integrity", "Attack Breadth", "Duration", and "Area Impacted" (repeated).</p>	<p>System of Systems Breakdown</p> <p>The diagram shows four interconnected components: "Access" (grey), "Network-based" (yellow), "Human-enabled" (blue), and "Supply Chain Insertion" (green). Arrows indicate bidirectional relationships between Access and Network-based, and between Network-based and Human-enabled.</p>	<p>Consequence-based Targeting</p> <p>Kill Chain Analysis</p> <p>The diagram depicts the Kill Chain Analysis process. It starts with "Targeting" (red) and follows a sequence of arrows pointing right: "Infection", "Spread", and finally "Effect".</p>	<p>Mitigations and Protections</p> <p>Kill Chain Mitigations</p> <p>The diagram shows the same Kill Chain Analysis process as above, but with red "no" symbols over the words "Targeting", "Infection", "Spread", and "Effect", indicating that mitigations are applied at these stages.</p>

Applied CCE Examples: Analog/Out-of-band Backstops

How to Begin to Apply CCE Concepts

- Sooner:
 - Begin to socialize HBR concepts with senior leaders and engineer/operators
 - Keep an eye open for the Getting Started with CCE guide
- Later:
 - Read the Intro to CCE book for practitioners, expected publication date: 2H2020
 - If interested, contact INL for potential 2-day orientation engagement

“THINK LIKE A HACKER, BUT ACT LIKE AN ENGINEER.”

Marty Edwards, Automation Federation (former Dir ICS-CERT)

Idaho National Laboratory
