 - Time to play!

POWER ON

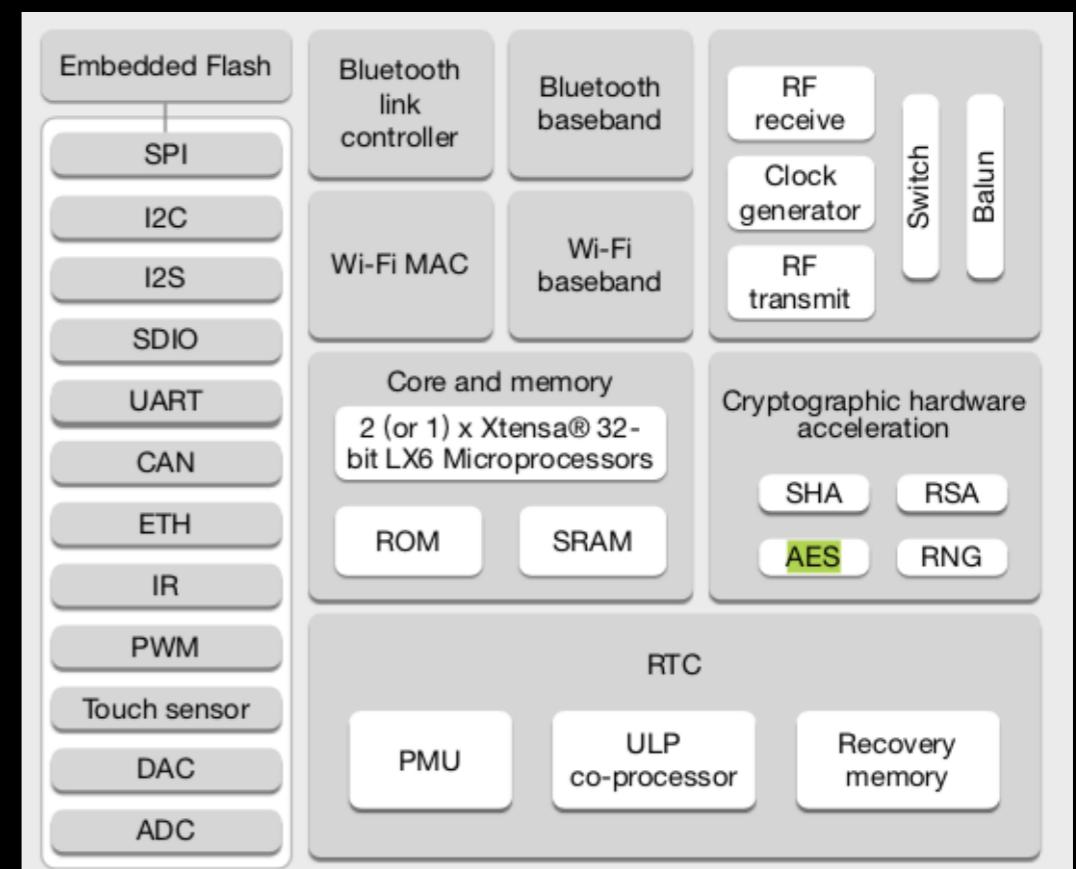

INTRODUCTION

The Entry Point

- Last April, I decide to ~~break~~ investigate into the ESP32
 - System-on-Chip (SoC) released in 2016 by Espressif
 - Widely-deployed (> 100M of devices) [1]
 - Wireless MCU/SoC Market leader
 - Claim to have ‘State-of-the-Art’ Security
 - 12 years-longevity commitment
- General Use
 - IoT
 - Wireless peripheral

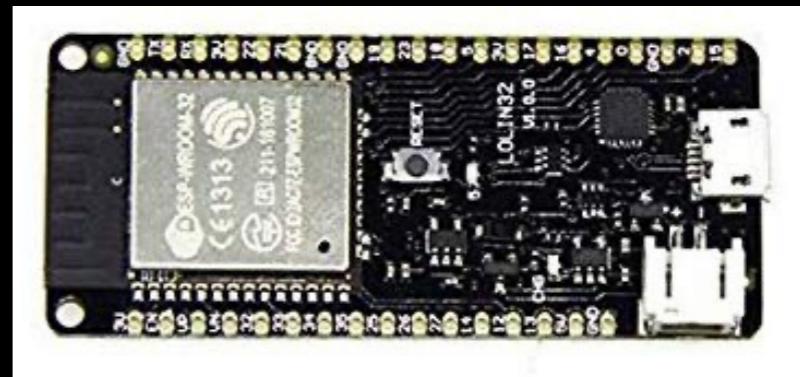

The target

- ESP32
 - Techno 40nm node
 - QFN 6*6, 48 pins
- Overview
 - Wi-FI (2.4GHz) & BT v4.2
 - Ultra Low-Power Xtensa Dual-Core LX6
 - up to 240MHz
 - ROM, SRAM, no CPU caches
 - GPIOs, Touch sensor, ADC...
 - 4 SPI, 3 UART, Ethernet...No USB

ESP32 Form Factor

- ESP32 SiP module (ESP32-WROOM-32)
 - Easy to integrate in any design
 - Flash storage 4MB
 - FCC certified
- ESP32 Dev-Kit (Lolin ESP32)
 - Micro-USB
 - Power
 - ttyUSB0 port
 - Pin headers
 - Limited Cost = 15\$

ESP32 Software

- Esp-idf Dev. Framework on Github
 - xtensa-esp32-elf toolchain
 - Set of Python Tools (esptool)
- Good Quality of Documentation
 - Datasheet and TRM available [2]
- Arduino core supported
 - I don't like pre-compiled libraries, I don't use it
- Official Amazon AWS IoT Platform
 - FreeRTOS, Mongoose OS...

Agenda Today

- Focus on Built-in Security
 - Just Grep the Datasheet
- Four Points
 - Crypto HW accelerator
 - Secure Boot
 - Flash Encryption
 - OTP
- Time to pwn!

1.4.4 Security

- Secure boot
- Flash encryption
- 1024-bit OTP, up to 768-bit for customers
- Cryptographic hardware acceleration:

OPTIONS MENU
SETTINGS

The Limited Plan

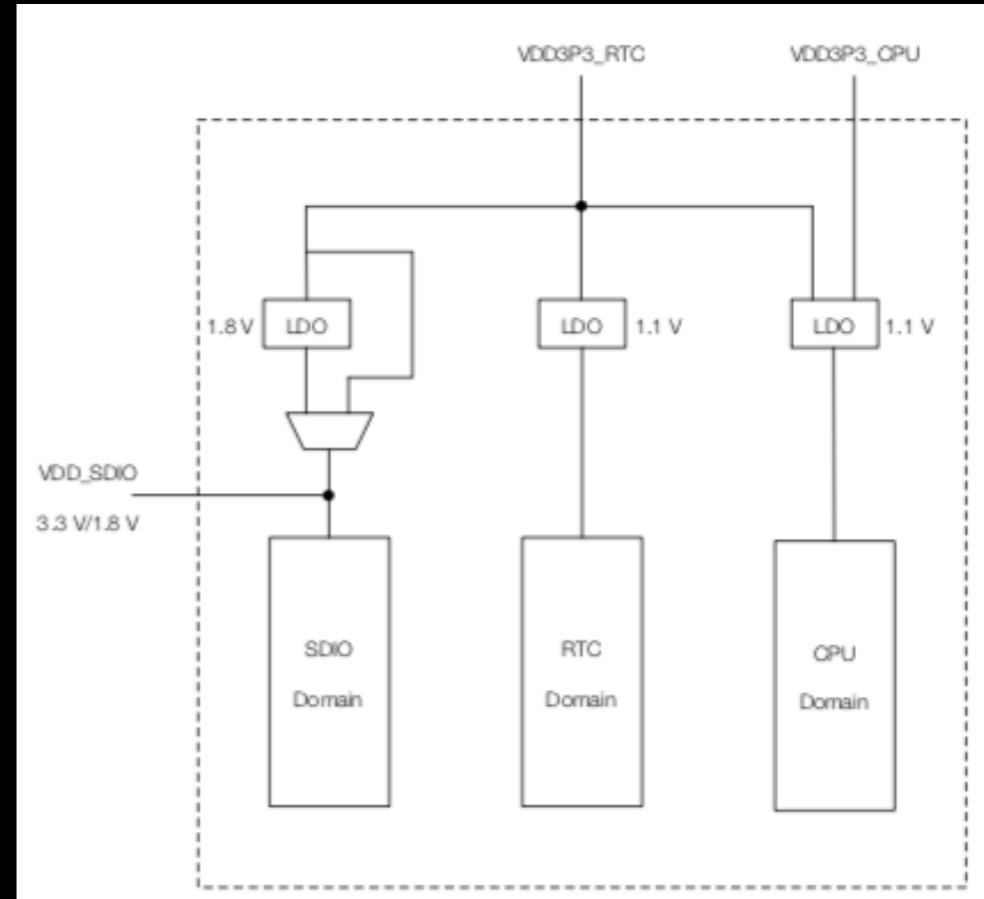

- The Context
 - 3 months to investigate (spare time)
- My Objective
 - Break one by one the Security Features
 - Physical Access Required (plausible attack scenario today)
- So, I will probably use HW Techniques
 - Fault Injection, Side Channel maybe?
 - Micro-soldering, PCB modification
 - Reverse
 - and Code Review ☺

Voltage Fault Injection

- aka Voltage glitching
 - Well-known, still efficient and Low-cost FI technique nowadays
 - Public resources about voltage glitching [3] [4] [...]
- Perturb the Power Supply to induce a fault during critical SW/HW operations
- Expected effects
 - Skip instruction
 - Data/Code modification
- Unexpected effects
 - Difficult to predict/understand faults in complex CPU architecture (due to Cache effects, Pipeline...)

Power domains inside ESP32

- 3 separate Power domains
- CPU domain shares two Power Signals
 - VDD3P3_CPU && VDD3P3_RTC
- Low Drop-out regulators (LDO)
 - Stabilize internal voltages
 - Filter effect against glitches?
- Brownout Detector (BOD)
 - « If the BOD detects a voltage drop, it will trigger a signal shutdown and even send a message on UART »
 - Able to detect glitches?
- BoD only effective on VDD_RTC
- So, I will Glitch on VDD3P3_CPU

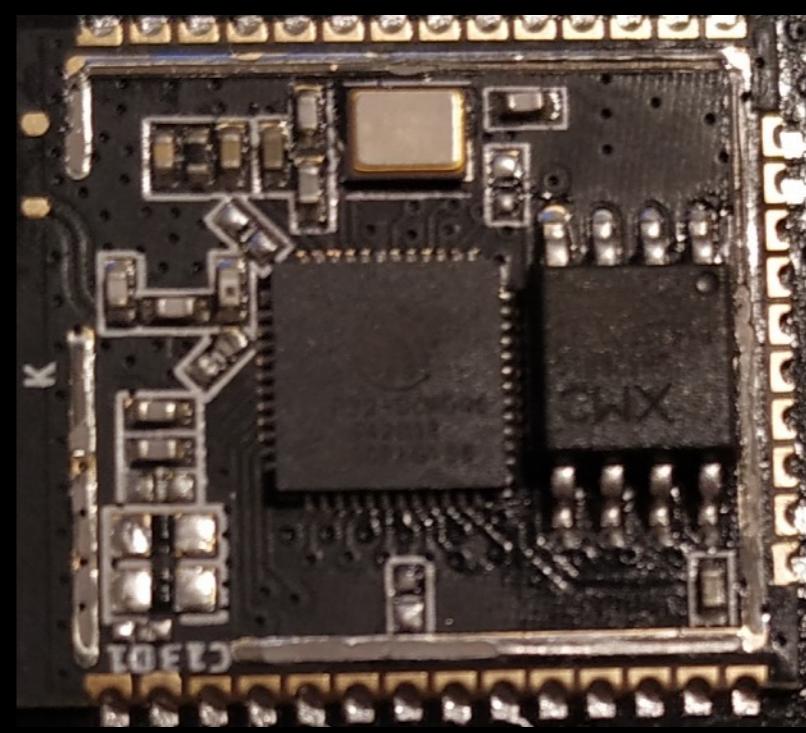

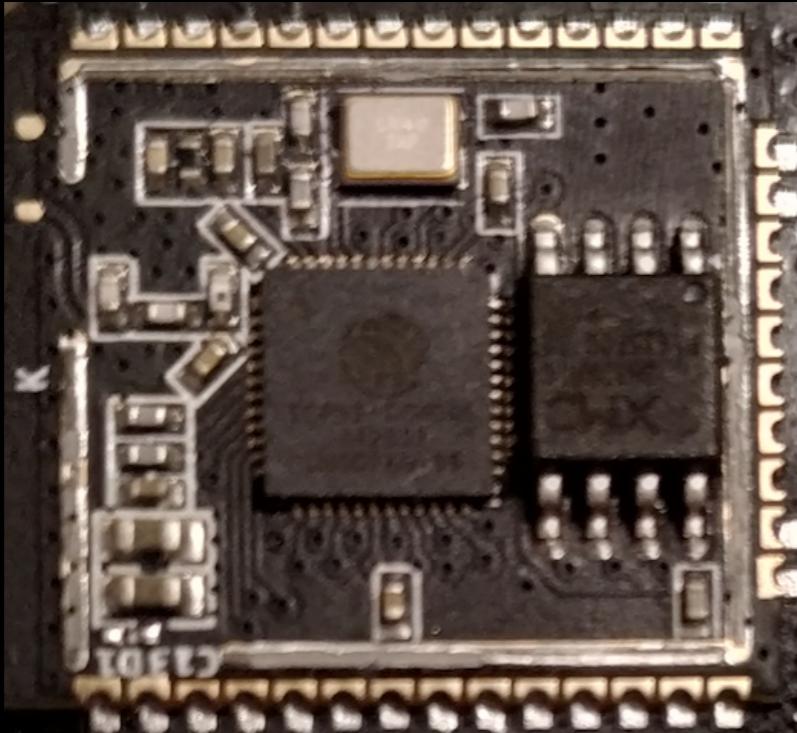

Brownout detector was triggered

```
ets Jun 8 2016 00:22:57  
COM is not ok  
['']
```

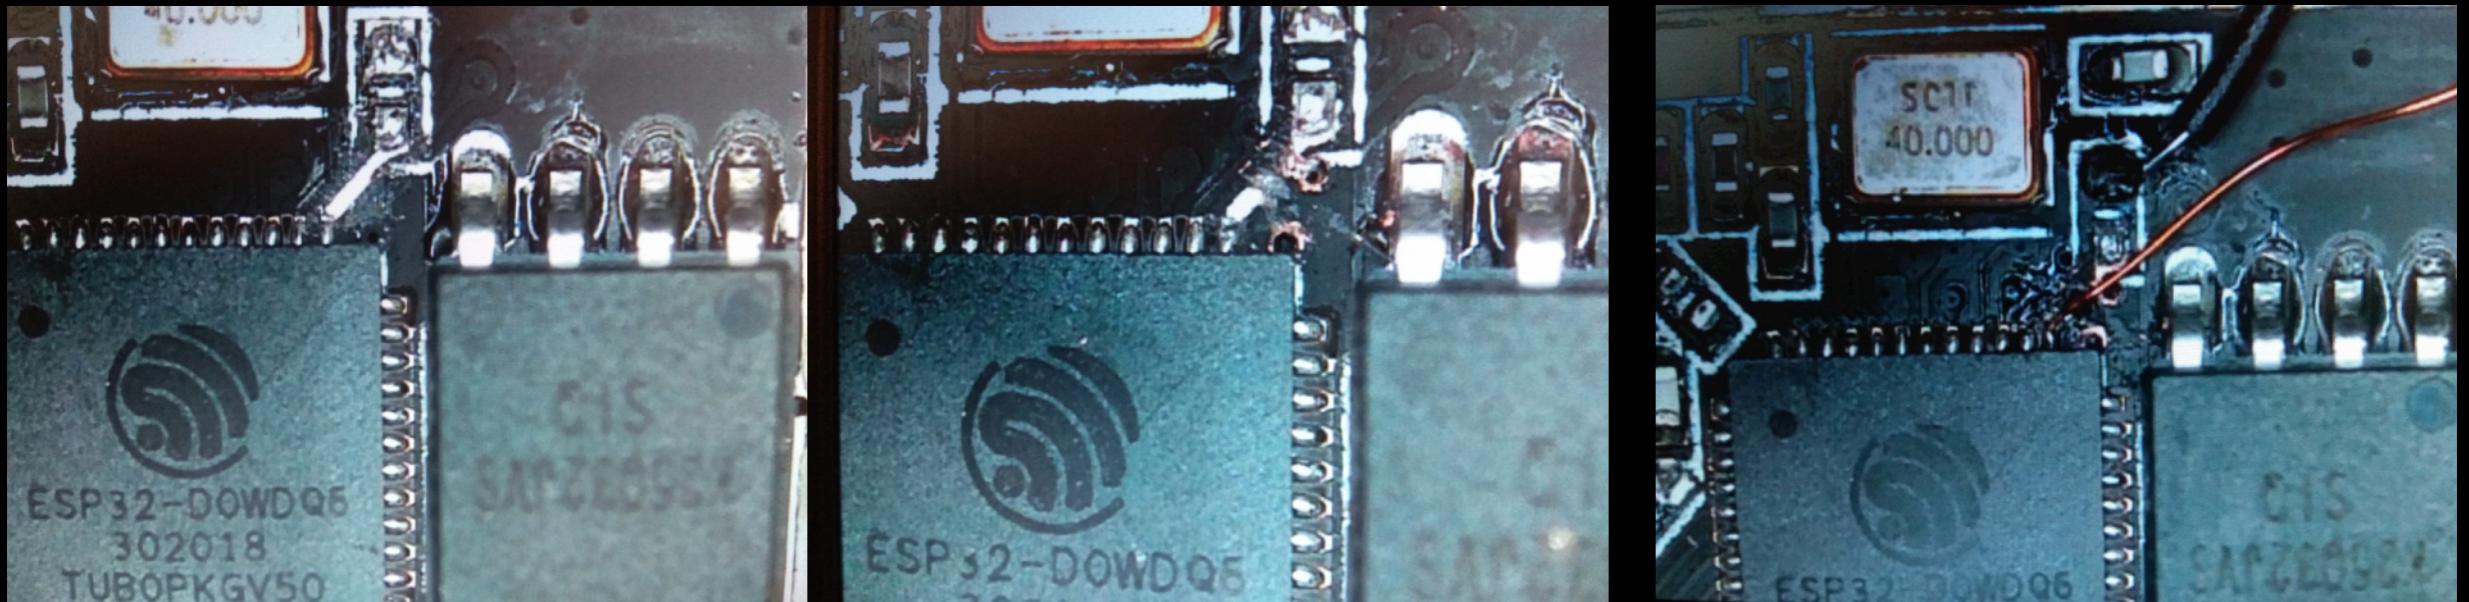

Target Preparation

- ESP-WR00M-32 Module
 - Shield is removed
 - No silkscreen but Schematic available
 - I remove Capacitors connected to VDD_CPU and VDD_RTC

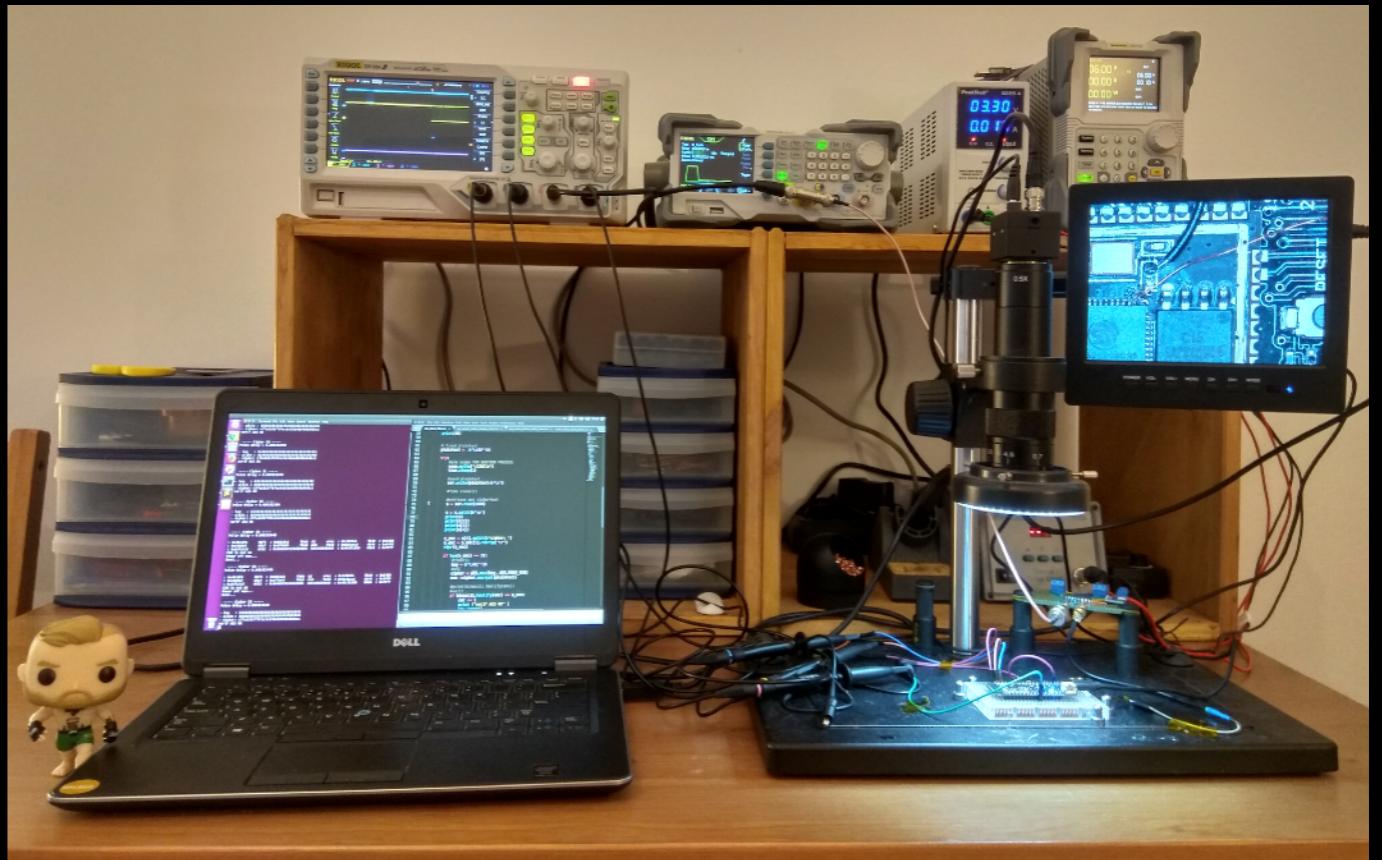

PCB Modification

- Three steps
 - Exposing the VDD_CPU trace (Pin 37)
 - Cutting the trace
 - Soldering the glitch output to VDD_CPU and GND

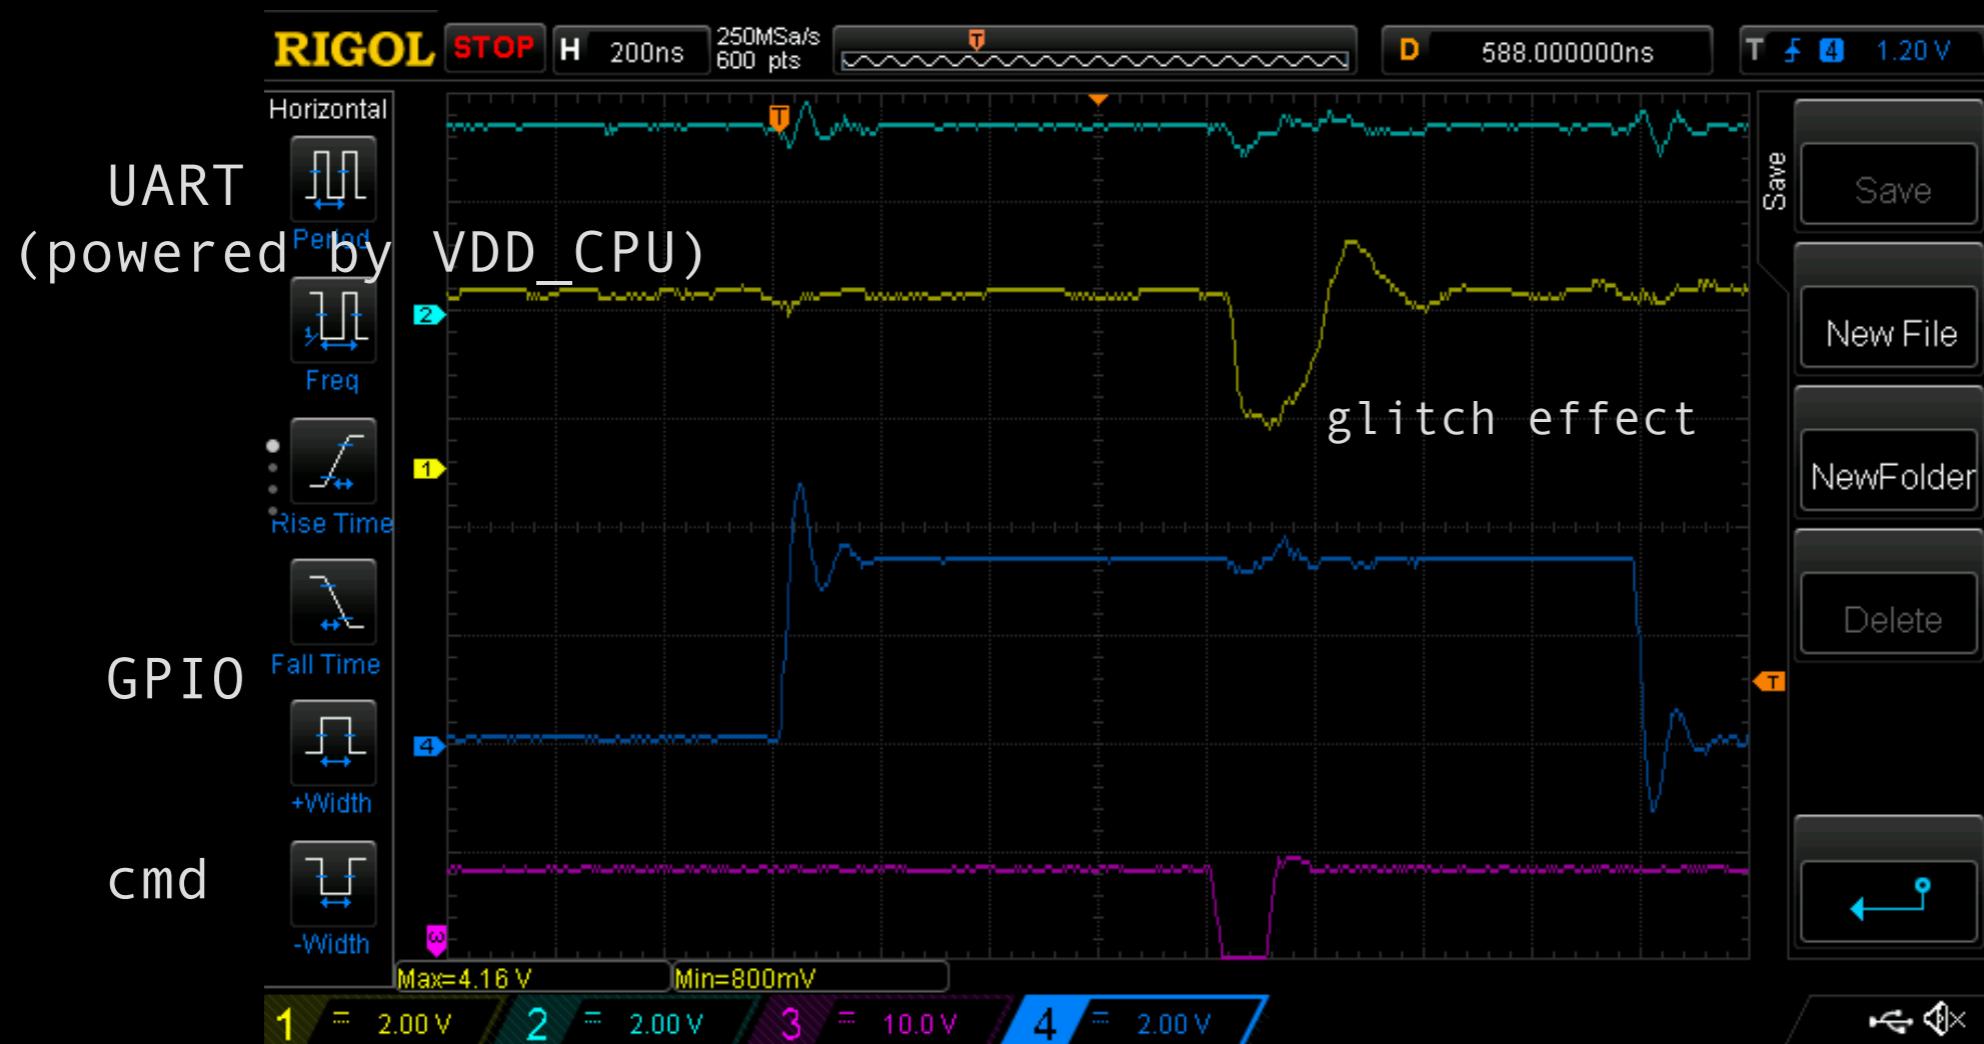

HW Setup

- Home-made Glitcher (10\$)
 - Based on MAX4619
 - Add passive components, SMA connectors
- Synchronised by Scope
- Triggered by Signal Generator
 - USB commands to set parameters
 - Delay
 - Width
 - Voltage
- Python scripts for full-control
 - Can run during days...

Voltage Glitching effect

- Effect looks good

LEVEL 1

THE CRYPTO-CORE

Crypto-Core/ Crypto-Accelerator

- Just a peripheral to speed-up the computation
 - AES, SHA, RSA...
- Why is it interesting to pwn?
 - Espressif Crypto-Lib
 - HW accel. used by default in MBedTLS
 - MBedTLS is the ARM crypto-library (all IoT are using it)
- My Goal
 - Focus on the CPU/Crypto interface (crypto-driver)
 - Do not expect to find ‘pure’ Software Vulns
 - Looking for vulns triggered by Fault Injection
 - It is Time for Code Review

Design Weakness

- AES operation

- Datasheet

Single Operation

1. Initialize AES_MODE_REG, AES_KEY_n_REG, AES_TEXT_m_REG and AES_ENDIAN_REG.
2. Write 1 to AES_START_REG.
3. Wait until AES_IDLE_REG reads 1.
4. Read results from AES_TEXT_m_REG.

- Design Weakness

- AES_TEXT_m_REG registers used to store plaintext and also ciphertext

- Encrypt-In-Place can be risky

- If something goes wrong during AES call, pretty sure I can retrieve the plaintext

- Pretty cool & simple to exploit as first PoC

Vuln n*1 = AES Bypass

- Previous Weakness is confirmed
- Multiple spots to trigger
 - AES start
 - The while condition
 - The last For loop
- PoC
 - Output = Input

```
---- Cipher 2 ----
- key : 61616161616161616161616161616161
- plain : 30303030303030303030303030303030
- cipher: c7fa6283f707ec9e55b6dd900bdb0bc1
verif AES OK

---- Cipher 3 ----
- key : 61616161616161616161616161616161
- plain : 30303030303030303030303030303030
- cipher: 30303030303030303030303030303030
!!!! AES core Pwned !!!!
```

```
* Call only while holding esp_aes_acquire_hardware().
*v4.0-dev-141-g106dc0590-dirty
static inline void esp_aes_block(const void *input, void *output)
{
    const uint32_t *input_words = (const uint32_t *)input;
    uint32_t *output_words = (uint32_t *)output;
    uint32_t *mem_block = (uint32_t *)AES_TEXT_BASE;

    for(int i = 0; i < 4; i++) {
        mem_block[i] = input_words[i];
    }

    DPORT_REG_WRITE(AES_START_REG, 1);

    DPORT_STALL_OTHER_CPU_START();
}

while (_DPORT_REG_READ(AES_IDLE_REG) != 1) { }
for (int i = 0; i < 4; i++) {
    output_words[i] = mem_block[i];
}
}

DPORT_STALL_OTHER_CPU_END();
```

Vuln $n^2 = \text{AES SetKey}$

- Vuln to trigger

- Unprotected for loop to load the key into the crypto-core

- PoC

- Key zeroized
- Persistent key value until the next setkey()
- Nice for attacking AES Cipher Block Chaining Mode

```
static inline void esp_aes_setkey_hardware( esp_aes_context *ctx, int mode)
{
    const uint32_t MODE_DECRYPT_BIT = 4;
    unsigned mode_reg_base = (mode == ESP_AES_ENCRYPT) ? 0 : MODE_DECRYPT_BIT;

    for (int i = 0; i < ctx->key_bytes/4; ++i) {
        DPORT_REG_WRITE(AES_KEY_BASE + i * 4, *((uint32_t *)ctx->key) + i);
    }

    DPORT_REG_WRITE(AES_MODE_REG, mode_reg_base + ((ctx->key_bytes / 8) - 2));
}
```

```
- key   : 61616161616161616161616161616161
- plain : 30303030303030303030303030303030
- cipher: e08682be5f2b18a6e8437a15b110d418
!!!! Set key Pwned !!!!
```

```
>>> from Crypto.Cipher import AES
>>>
>>> aes = AES.new(b'\x00' * 0x10, AES.MODE_ECB)
>>> cipher = aes.encrypt(b'0' * 0x10)
>>> print(''.join('{:02x}'.format(x) for x in cipher))
e08682be5f2b18a6e8437a15b110d418
...
```

Crypto-Core Conclusion

- Crypto-core does not improve security
- Six Vulns with PoCs in AES and SHA
 - Espressif HwCrypto in esp-idf 4.0 (patched since)
 - ARM MbedTLS v2.13.1 (patched?)
- Resp. disclosure
 - No answer from Espressif & ARM during 1 month 😞
 - Silent Patch attempt 😞
 - BugBounty Program from ARM MBedTLS is Fake 😞
- I am was a little bit in a FURY
- ...ready to pwn harder

LEVEL 2

SECURE BOOT

Role of Secure Boot

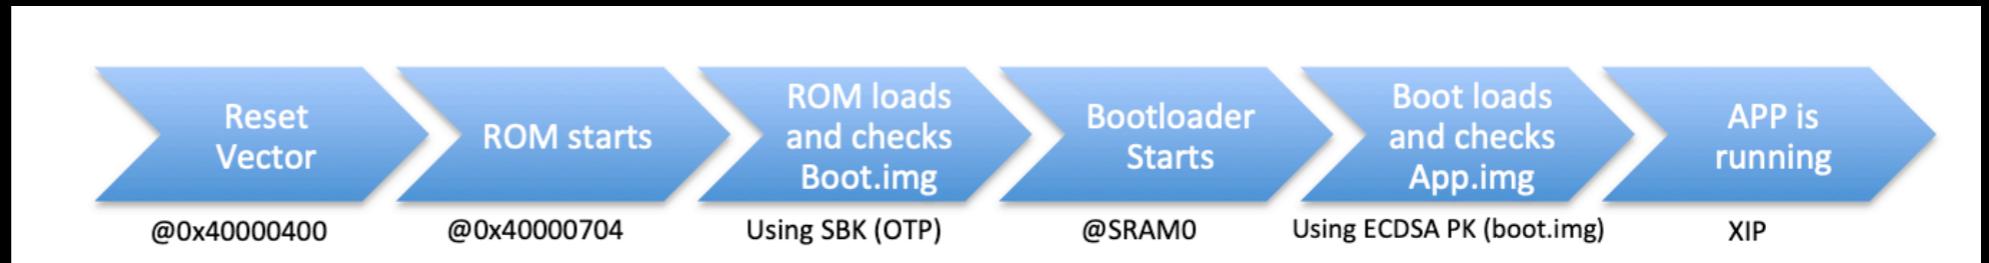

- Protector of FW Authenticity
- Avoid FW modification
 - Easy to flash malicious Firmware in SPI Flash
 - CRC? Not sufficient sorry...
- It will Create a Chain of Trust
 - BootROM to Bootloader until the App
- It Guarantees the code running on the device is Genuine
 - Will not boot if images are not properly signed

Sec. Boot during Production

- Secure Boot Key (SBK)
 - SBK burned into E-Fuses BLK2
 - This SBK cannot be readout or modified (R/W protected)
 - Used by bootROM to perform AES-256 ECB
- ECDSA key pair
 - Created by the App developer
 - Priv. Key used to sign the App, Pub. Key integrated to bootloader.img
- The Bootloader Signature
 - 192 bytes header = 128 bytes of random + 64 bytes digest
 - Digest = SHA-512(AES-256((bootloader.bin + ECDSA PK) , SBK))
 - Random at 0x0 in Flash Memory layout, digest at 0x80

Sec. Boot on the Field

- Boot process

- Verification Mechanisms

- BootROM (Stage 0)
 - Compute Digest with SBK and compare with 64-bytes Digest at 0x80
- ECDSA verification by the Bootloader (Stage 1)
 - Micro-ECC is used
- I will Focus on Stage 0
 - Signature based on Symmetric Crypto
 - SBK = AES-Key used to sign the bootloader (CRITICAL ASSET) stored in E-Fuses, R/W protected

Set the Secure Boot

Secure boot in Action

- Signed Code (using SBK)

```
void app_main()
{
    while(1)
    {
        printf("Hello from SEC boot K1 !\n");
        vTaskDelay(1000 / portTICK_PERIOD_MS);
    }
}
```

- make flash, then it runs

```
ets Jun  8 2016 00:22:57

- Stuck in stage0, perfect

Bypass the Sec.Boot

- Why?
 - to have code exec
- How?
 - Force ESP32 to execute my unsigned bootloader to load my unsigned app
- Focus on BootROM
 - Always Nice to exploit BootROM vulns, and always difficult to Fix BootROM vulns
- So, I need to reverse the bootROM
- But first, I need to dump it...

Dump the BootROM

- Memory map

Category	Target	Start Address	End Address	Size
Embedded Memory	Internal ROM 0	0x4000_0000	0x4005_FFFF	384 KB
	Internal ROM 1	0x3FF9_0000	0x3FF9_FFFF	64 KB
	Internal SRAM 0	0x4007_0000	0x4009_FFFF	192 KB
	Internal SRAM 1	0x3FFE_0000	0x3FFF_FFFF	128 KB
		0x400A_0000	0x400B_FFFF

	RTC FAST Memory	0x3FF8_0000	0x3FF8_1FFF	8 KB
		0x400C_0000	0x400C_1FFF	
	RTC SLOW Memory	0x5000_0000	0x5000_1FFF	8 KB

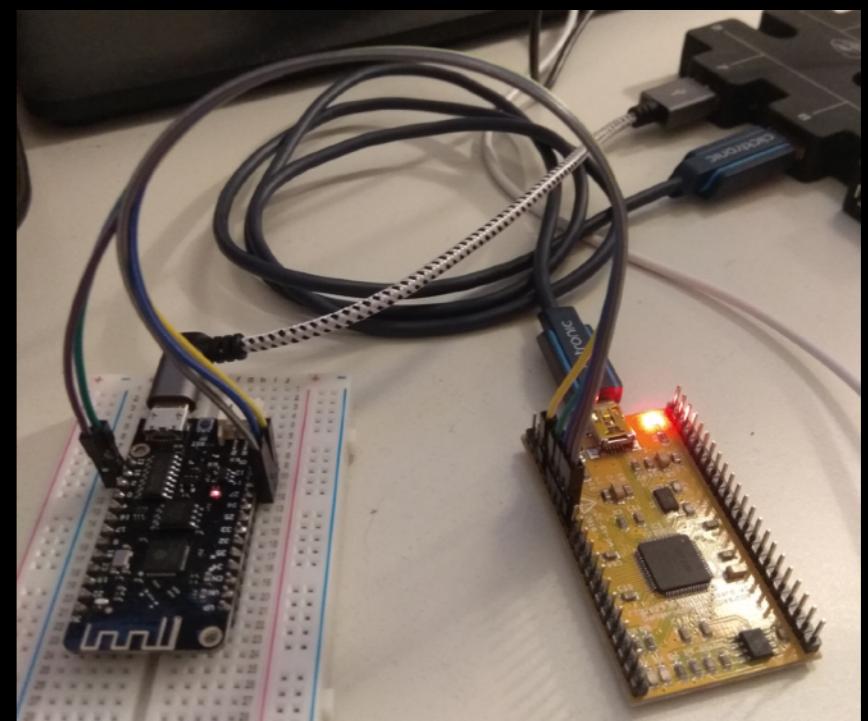

- Remember I didn't burn JTAG
DISABLE E-Fuse?

- FT2232H board (20\$)
- OpenOCD + xtensa-esp32-gdb

- Full Debug Access

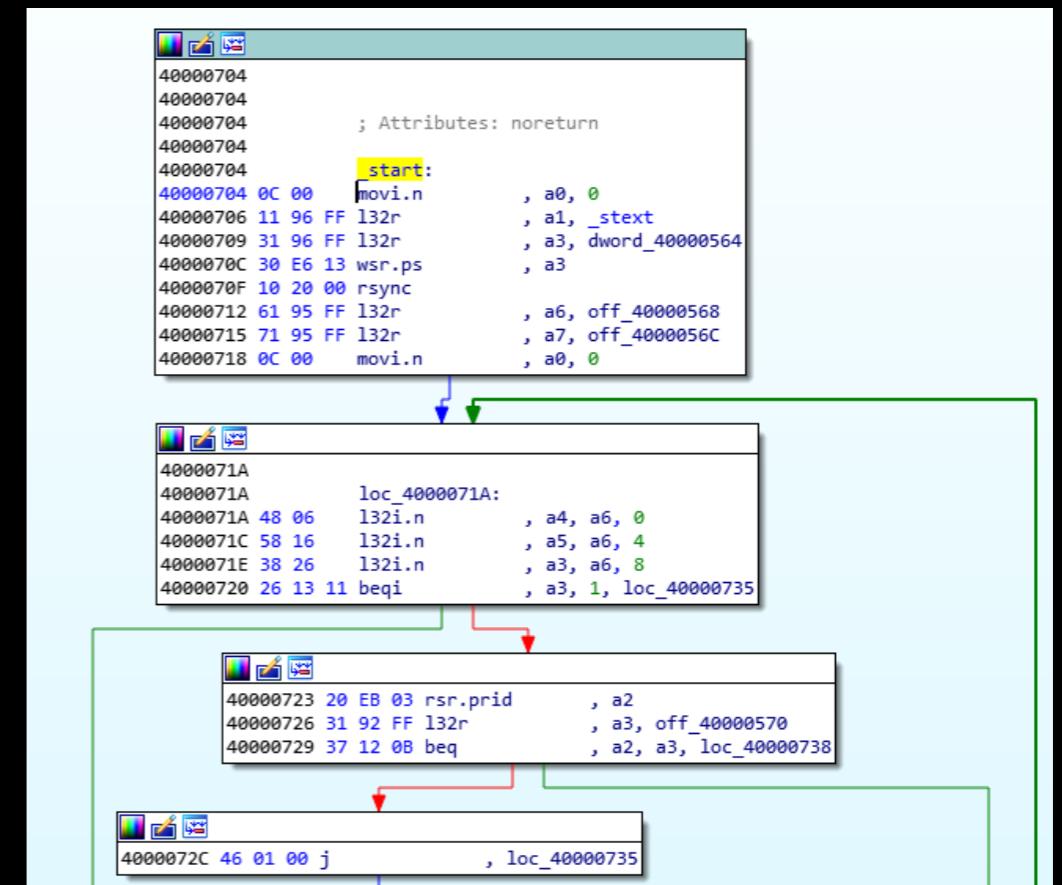

- Reset Vector 0x40000400
- BootROM dumped

```
(gdb) target remote :3333
Remote debugging using :3333
0x40000400 in ?? ()
(gdb) █
```

BootROM Reverse

- Xtensa is ‘exotic’ arch
 - registers windowing, lengths of instr...
 - ISA [5]
- IDA
 - ida-xtensa plugin from @themadinventor
- Secure_boot.h
 - List all the ROM functions (deprecated since...)
- Call a friend to check my mess
 - @wiskitki
- At the end, not perfect but doable
 - _start at 0x40000704 (as expected)

The BootROM Vuln

- After ets_secure_boot_check_finish()

The screenshot shows a debugger interface with three windows. The top window displays assembly code from address 40007595 to 400075B7. The middle window is a terminal showing the text "secure boot check fail". The bottom window shows assembly code starting at 400075C5.

Top Window (Assembly):

```
40007595 21 C6 FC l32r      , a2, dword_400068B0
40007598 C1 C5 FC l32r      , a12, dword_400068AC ; 0x3F400000
4000759B BD 0A movi.n       , a11, a10
4000759D 20 DD 10 and      , a13, a13, a2
400075A0 4C 0E movi.n       , a14, 0x40
400075A2 FD 05 movi.n       , a15, a5
400075A4 A5 03 02 call8     , cache_flash_mmu_set_rom
400075A7 0C 0A movi.n       , a10, 0

400075AC A1 99 FE l32r      , a10, dword_40007010
400075AF 38 71 l32i.n       , a3, a1, 0x1C
400075B1 A0 A3 80 add       , a10, a3, a10
400075B4 E5 64 55 call8     , ets_secure_boot_check_finish
400075B7 66 1A 0A bnei       , a10, 1, loc 400075C5
```

Middle Window (Terminal):

```
secure boot check fail
```

Bottom Window (Assembly):

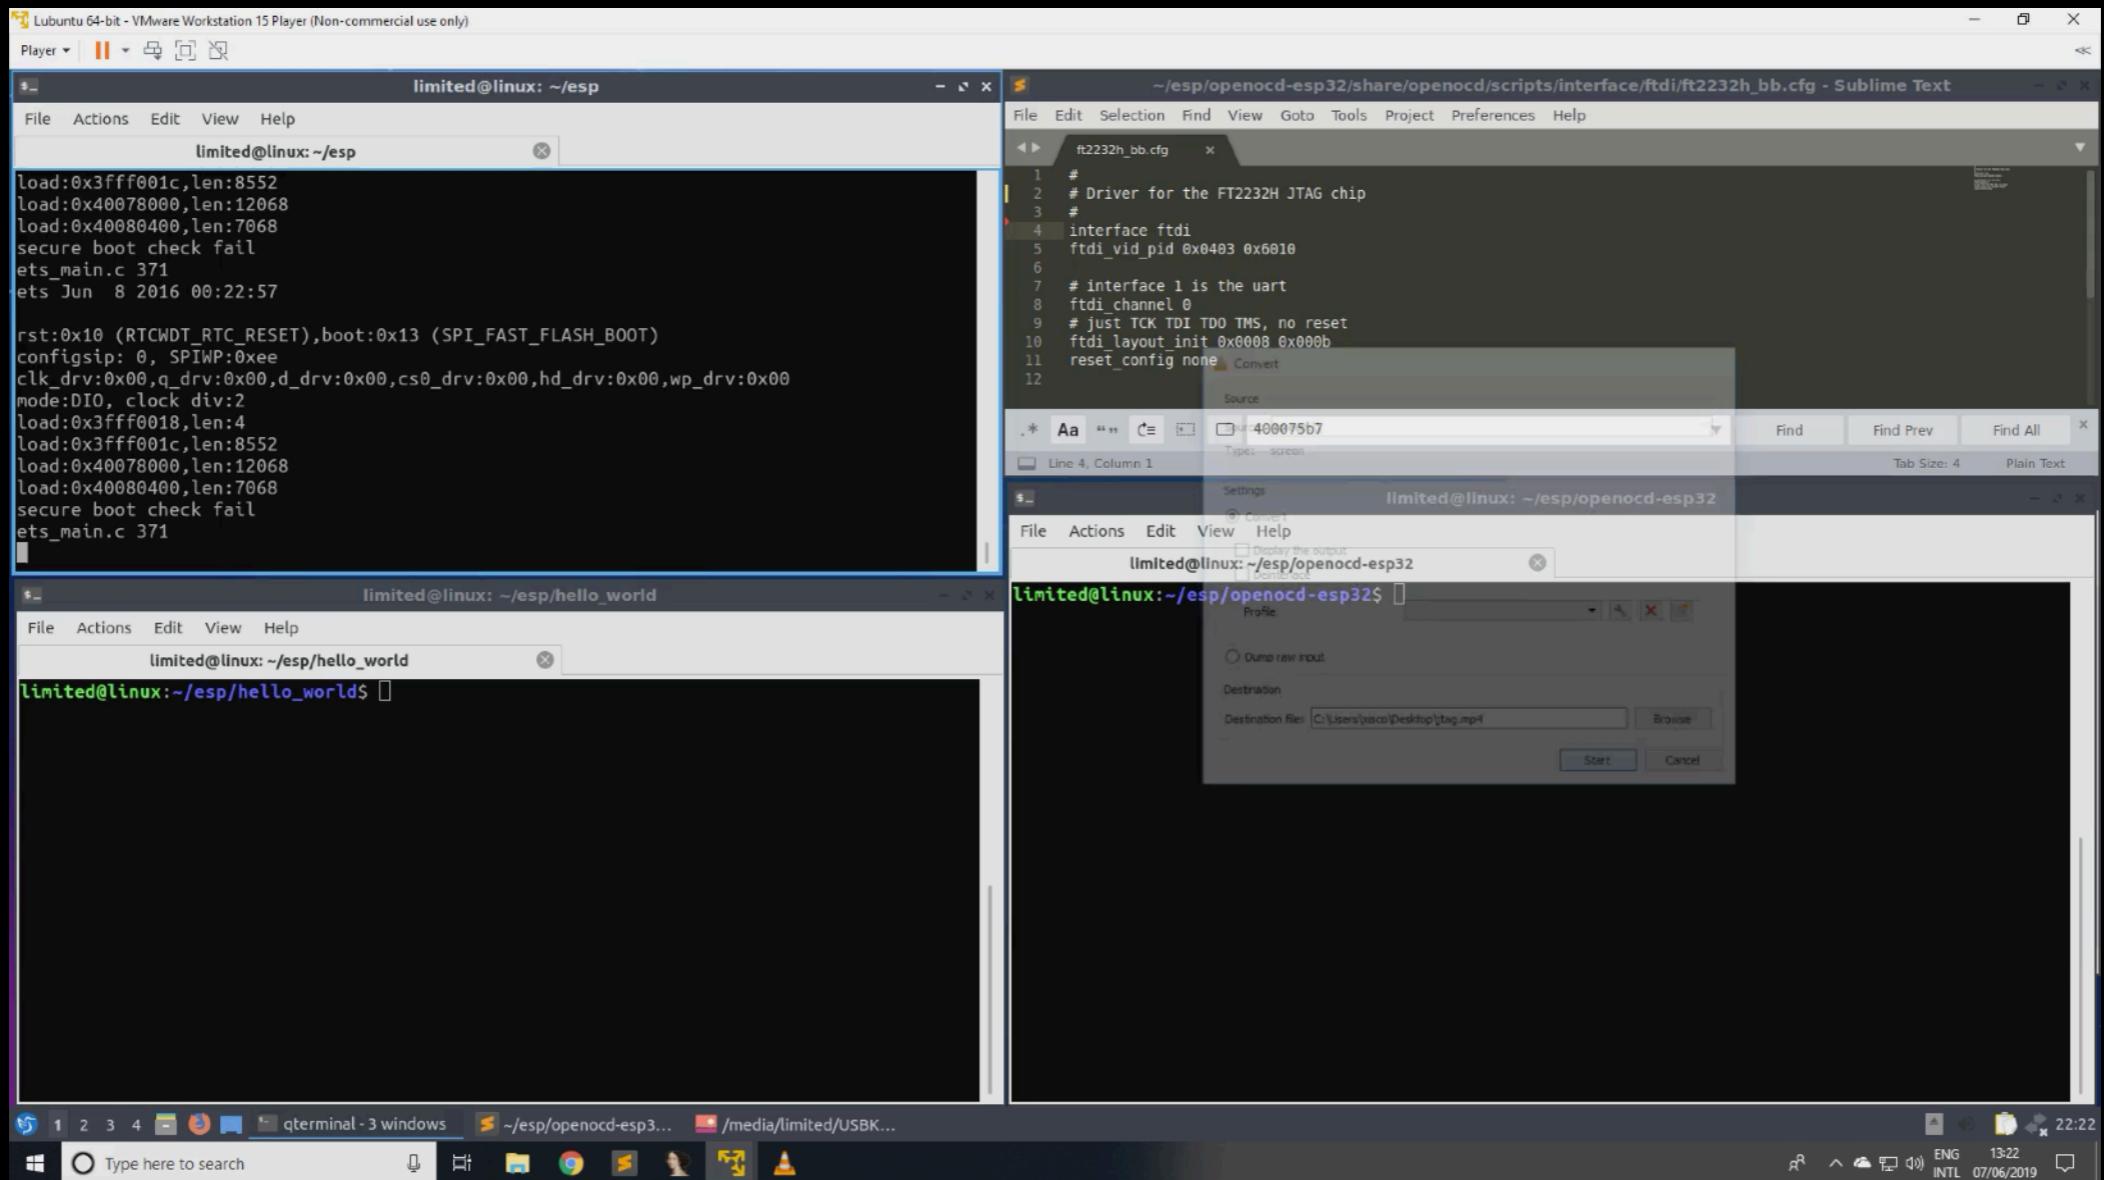

```
400075C5
400075C5 loc 400075C5:
400075C5 0C 0A movi.n       , a10, 0
400075C7 25 4F 02 call8     , Cache_Read_Disable_rom
400075CA 0C 0A movi.n       , a10, 0
400075CC 65 44 02 call8     , Cache_Flush_rom
400075CF 31 8C FE l32r      , a3, off_40007000
400075D2 21 8C FE l32r      , a2, off_40007004
400075D5 C0 20 00 memw      , a6, a3, 0
400075D8 68 03 l32i.n       , a6, a3, 0
```

- Bnei (Branch if not equal immediate)

- Depends on a10 Register storing sec_boot_check_finish() retvalue
- I want PC jump to 0x400075C5 to execute the bootloader

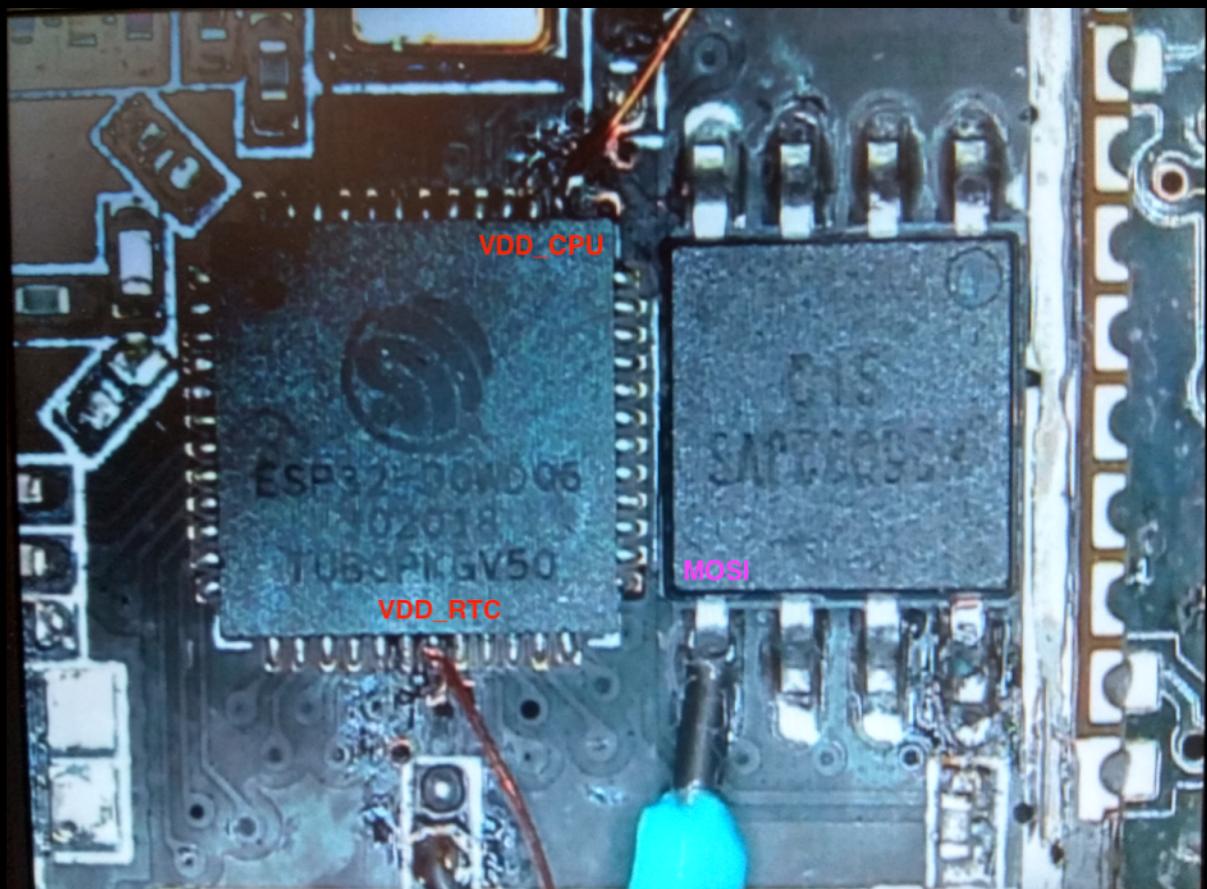

Jtag Exploit Validation

- Set a10 register = 0 via JTAG to bypass secboot

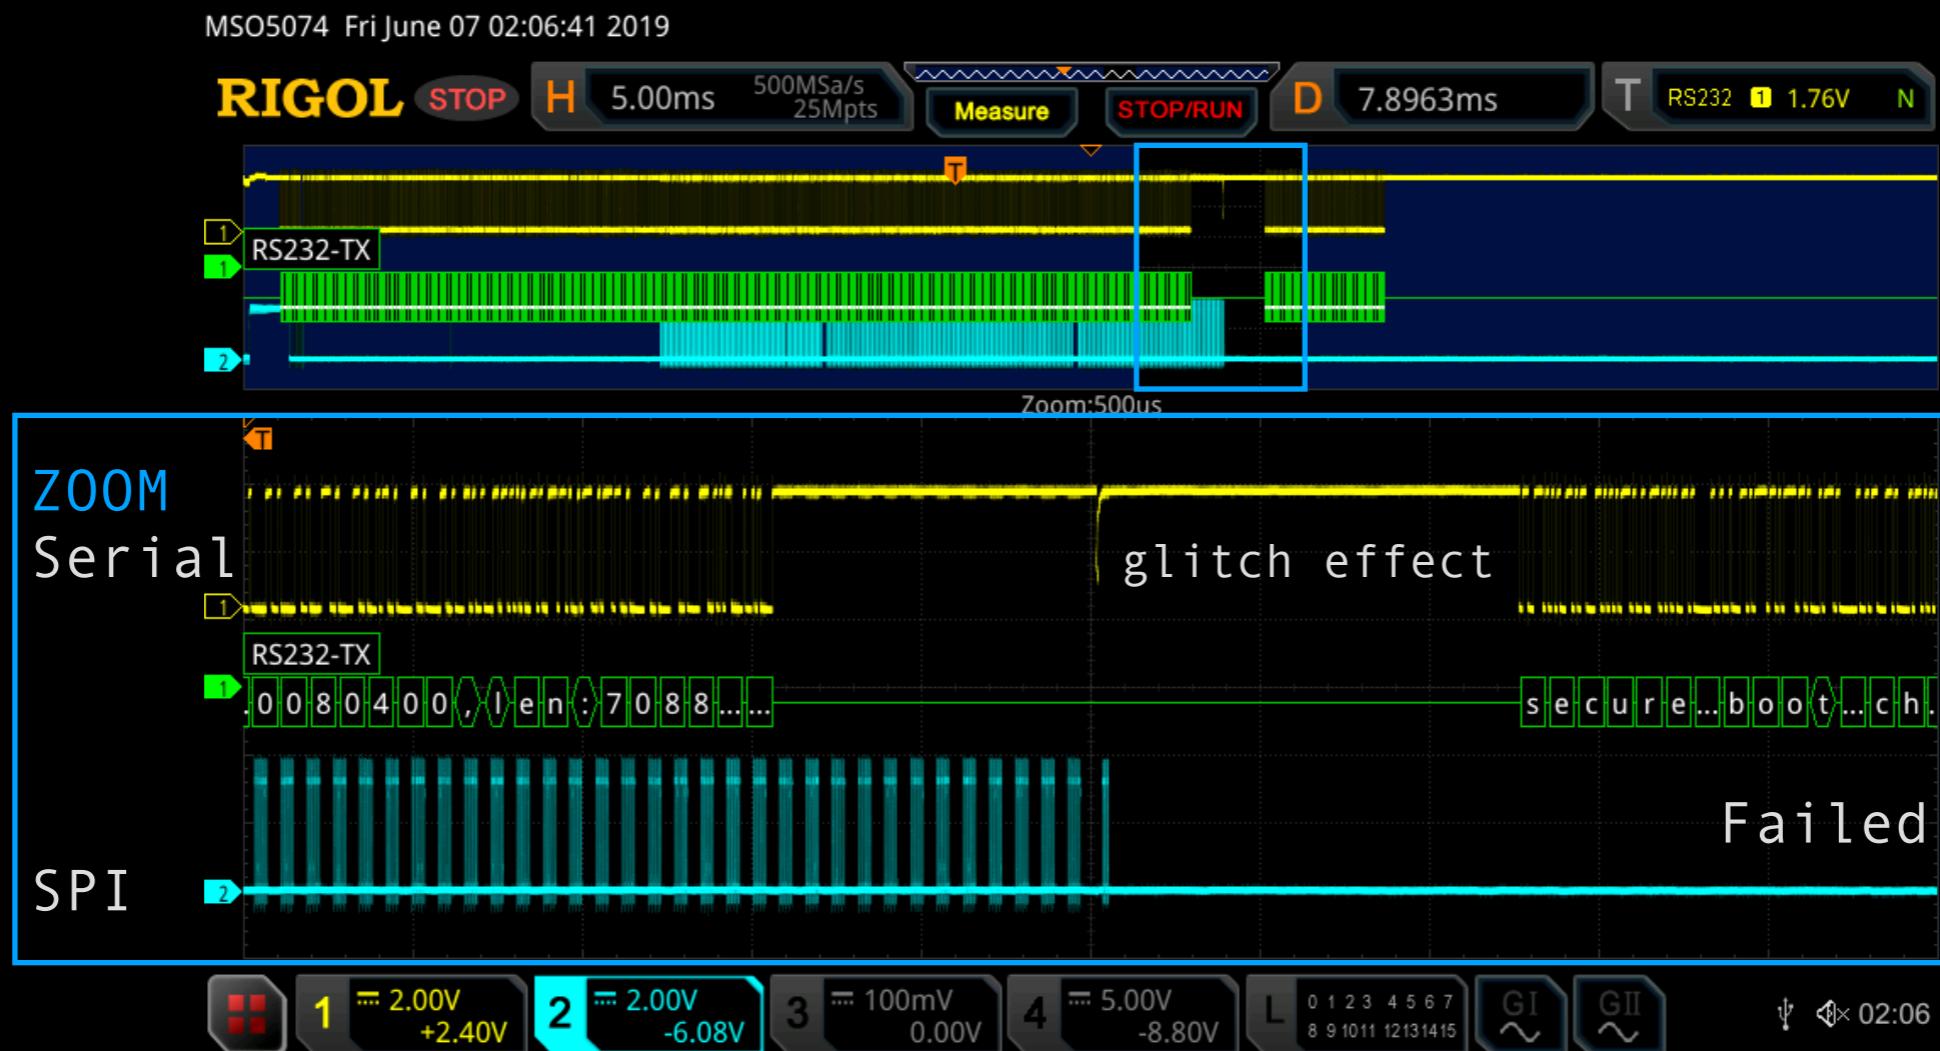

Time to Pwn (for Real)

- Real Life
 - JTAG is disabled
 - I could not find a way to exploit this Vuln by SW
- So, Fault Injection is my only way here
 - Simultaneous glitch on VDD_CPU && VDD_RTC
 - SPI MOSI is probed to have a timing information

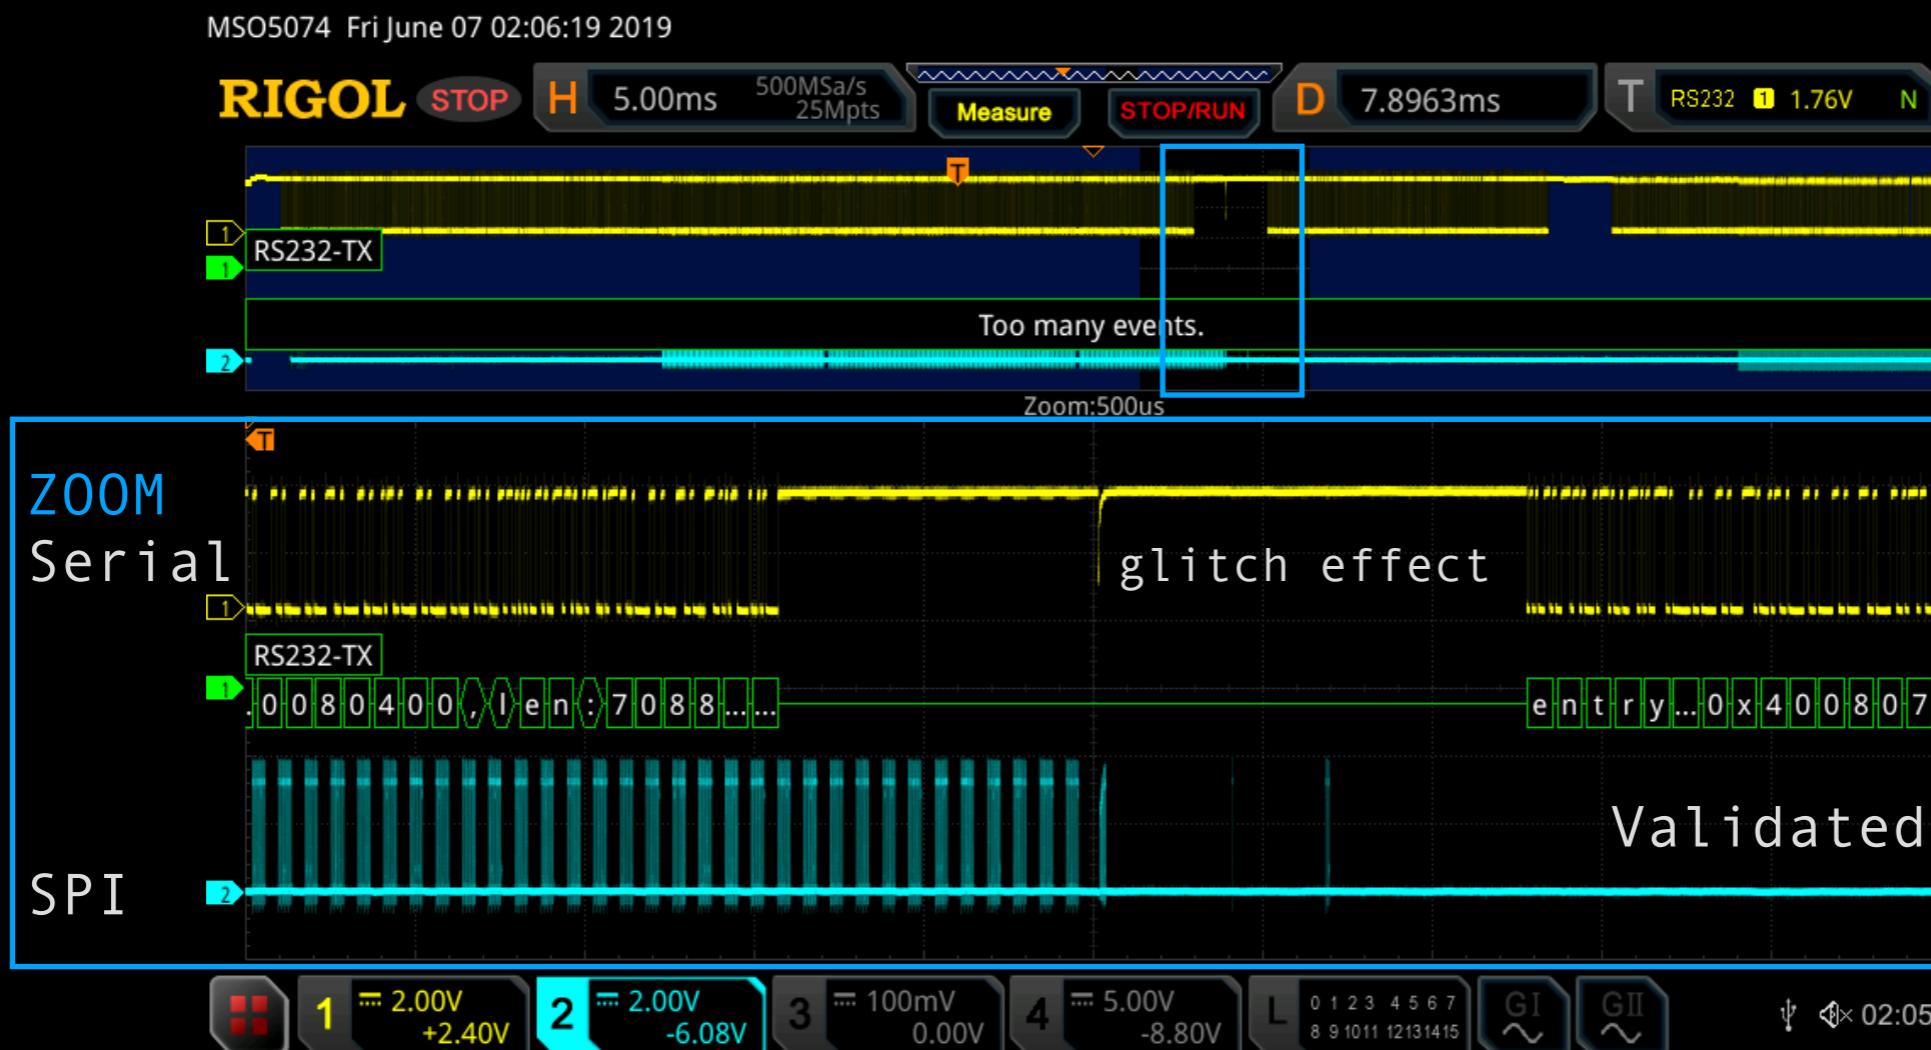

FI attempt during Boot

- Previous BootROM Reverse is helpful
 - to determine Fault injection Timing

Successful Sec. Boot Bypass

- CPU is jumping to the entry point,
Bootloader is executed

PoC Secure Boot

- Sorry for the tilt

The screenshot shows a Linux desktop environment with several windows open:

- A terminal window titled "spi flash pinout" displaying boot log messages.
- A terminal window titled "GitHub - espressif" showing a GitHub repository page.
- A terminal window titled "Secure" showing a Python script for a Rigol scope.
- A file editor window titled "notes_sec_boot.txt" containing Python code.

The terminal logs show multiple attempts at booting, each failing due to a secure boot check. The Python script in the file editor is intended to interact with a Rigol scope for signal analysis.

23
24
25 #variables
```

Secure Boot Conclusion

- Secure Boot Bypass exploit
 - bootROM Vuln triggered by Fault Injection
 - Not persistent if Reset occurs
 - No way to Fix this without ROM revision
- Resp. disclosure
 - PoC sent on June 4, Posted on September 1
 - Security Advisory on Sept. 2
 - CVE-2019-15894 (requested by Vendor)
 - Patched by Flash Encryption always enabled
 - A security lab, called Riscure, found the same vuln
- Job done

LEVEL 3

FLASH ENCRYPTION

Role of Flash Encryption

- Protector of FW Confidentiality
 - Protect against binary Reverse
- Without FE, it is easy to extract sensitive data
 - LIFX Wi-Fi lightbulb [6]
- Firmware Encryption more and more present Today
- Espressif recommends Secure Boot + Flash Encryption for maximum Security

The screenshot shows the Hackaday homepage with a navigation bar including HOME, BLOG, HACKADAY.IO, TINDIE, HACKADAY PRIZE, SUBMIT, and ABOUT. The main article title is "DON'T TOSS THAT BULB, IT KNOWS YOUR PASSWORD" by Tom Nardi. It includes social sharing links for Facebook, Twitter, and Google+, and a comment count of 68. The date is January 29, 2019. Below the title is a photograph of a green printed circuit board (PCB) with several wires connected to it.

The screenshot shows the Motherboard by VICE website with a navigation bar including Video, Podcasts, News, Tech, Music, Food, Health, Money, and More. The article title is "This Hacker Showed How a Smart Lightbulb Could Leak Your Wi-Fi Password" by Daniel Oberhaus. It includes a timestamp of Jan 31 2019, 6:27pm. A sidebar note states: "The ‘moderate to severe’ vulnerabilities discovered by the hacker LimitedResults have since been fixed, according to the smart bulb company LIFX."

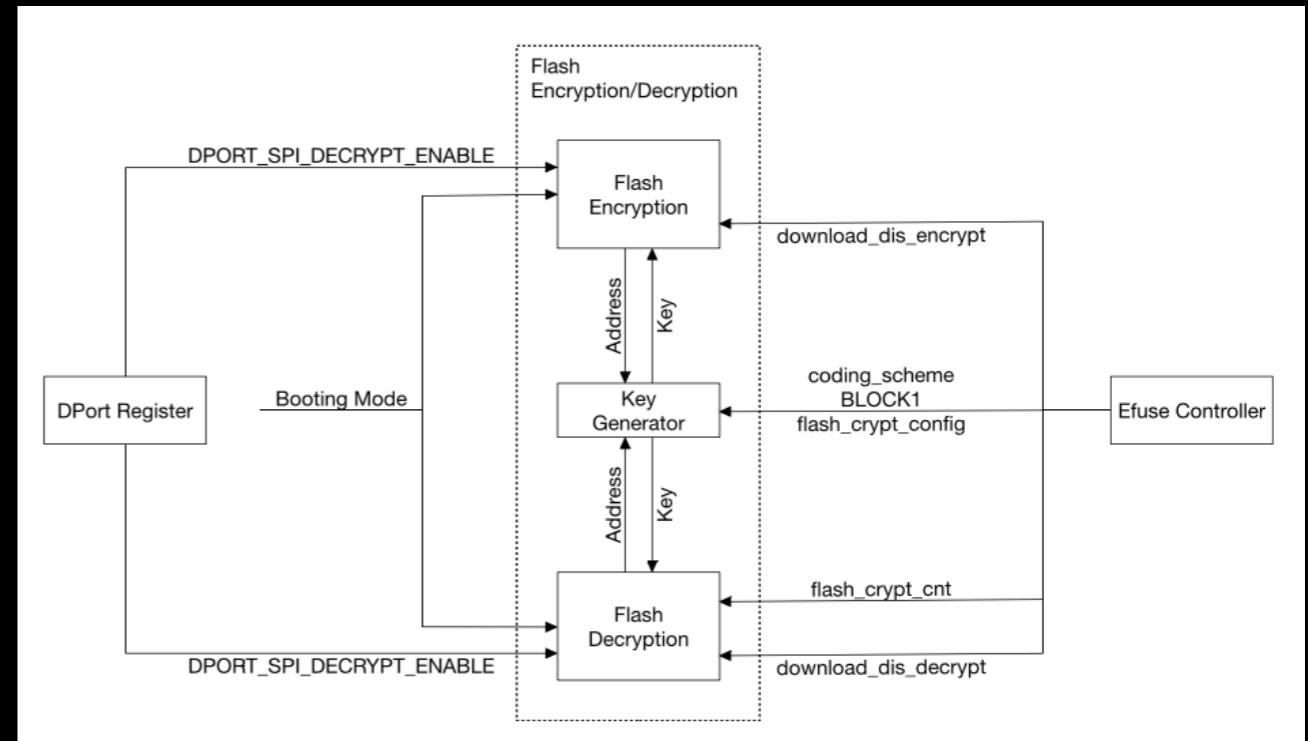

Flash Encryption Review

- HW Enc./Dec. Block in Flash Memory Controller

- Fetch Key from E-Fuses and other parameters
- Decrypt/Encrypt I/D into a Cache
- SW cannot access

- Flash Encryption Key (FEK)

- AES-Key used to decrypt the FW
- Stored in E-Fuses BLK1 (R/W protected)
- CRITICAL ASSET (of course)

Set the Flash Encryption

- Burn the FEK into BLK1
 - \$ espefuse.py --port /dev/ttyUSB0 burn_key flash_encryption my_flash_encryption_key.bin
 - Activate the Flash Encryption
 - \$ espefuse.py burn_efuse FLASH_CRYPT_CONFIG 0xf
 - \$ espefuse.py burn_efuse FLASH_CRYPT_CNT
 - Flash encrypted FW into ESP32
 - E-Fuses Map
 - FW is encrypted

How to break Flash Encryption?

- I did some tests (believe me...)
 - Did not find particular Weakness to access the Key by SW
 - Did not find a way to Attack by DFA
- My Last Hope was Side Channel Analysis to target the Bootloader Decryption
 - But my setup was too ‘limited’
 - SPI bus producing a lot of Noise
 - Cannot control the SPI frames properly
 - I tried DPA, CPA... but not enough leakage
 - One week later, no result...

```
I (973) cpu_start: Pro cpu start user code
I (320) cpu_start: Starting scheduler on PRO CPU.
I (0)  cpu_start: Starting scheduler on APP CPU.
Hello from SEC boot K1 & FE !
```

Flash Encryption Conclusion

- I lost...

CONTINUE

Watch your opponent's technique
very carefully... and you will
find his weak point...

EXTRA-COIN

OTP/E-FUSES: THE MOTHER OF VULNS

Role of OTP/E-Fuses

- One-Time-Programmable (OTP) Memory based on E-Fuses in ESP32
 - An e-Fuse can be ‘programmed’ just ‘One-Time’ from 0 to 1
 - Once burned, no possibility to rewrite it or to wipe it
- Organisation
 - EFUSE_BLK0 = ESP32 configuration
 - EFUSE_BLK1 = Flash Encryption Key (FEK)
 - EFUSE_BLK2 = Secure Boot Key (SBK)
 - EFUSE_BLK3 = reserved for User Application
- According to Espressif, these E-Fuses are R/W protected and cannot be readout/modified once protection bits set
- E-Fuses are managed by the E-Fuses Controller, a dedicated piece of HW inside the ESP32

ESP32 E-Fuses Reverse

- Only two identified functions
 - efuse_read and efuse_program
- Used during a ‘Special Boot mode’
 - interesting...
- BootROM never touch OTP values
- It means only the E-Fuses Controller has access to OTP
 - Pure HW Process
 - Has to be set before BootROM execution

```

Special Boot Mode

- ESP32 in Special Boot Mode (Download_Boot)
 - Management mode to Flash FW, and Set E-Fuses
 - IO0 connected to GND then Power-up

```
rst:0x10 (RTCWDT_RTC_RESET),boot:0x21 (DOWNLOAD_BOOT(UART0/UART1/SDIO_FEI_RE0_V)
waiting for download
```

- Esptool is python utility to communicate with the ROM functions
 - Dedicated commands available from UART0 to deal with E-Fuses
 - dump, program,...

E-Fuses Protection

- Any attempt to read BLK1 or BLK2 returns 0x00
 - \$ espefuse.py --port /dev/ttyUSB0 dump

```
espefuse.py v2.7-dev
Connecting....
EFUSE block 0:

```

- Identification of R/W Protection bits in BLK0
- 00130180 = 00000000 00010011 00000001 1000 0000
 - These two bits are the Read protect bits

Wait LR, where is the Vuln?

- I have no Vuln here sorry...
- But I know
 - BootROM does not manage the E-Fuses
 - Obviously, E-Fuses Controller does the job before
 - Special boot mode called ‘Download_Boot’
 - Read protection bits have been identified
- The idea
 - Glitch the E-Fuses Controller initialization to modify the R/W protections
 - Then send Dump command in Special Mode
 - Readout BLK1 (FEK) and BLK2 (SBK)

FATAL Glitch

- Simple Power Analysis to identify HW process
- Glitch during this identified activity

FATAL Results

- SBK and FEK extracted from eFuses

```

One more step

- Sadly, the dumped Keys are not exactly True values
 - Remember I burned the keys ☺
- Offline Statistical Analysis on 30-50 dumped key values
 - just Keep the most recurrent Bytes (here SBK analysis)
- 1 Byte still unknown and has to be Brute Forced (worst case)
 - Same for FEK

FATAL Exploit step 1: Decrypt FW

- Dump the encrypted FW
 - By Download Mode or by dumping Flash
- Perform FATAL Glitch to extract FEK and SBK
 - Run Statistical analysis
- Confirm the True FEK (by decrypting FW)

```
limited@linux:~/esp/bin_decrypt_dump$ espsecure.py decrypt_flash_data --keyfile my_dumped_fek.bin --output decrypted.bin --address 0x0 flash_contents.bin
espsecure.py v2.7-dev
Using 256-bit key
limited@linux:~/esp/bin_decrypt_dump$ strings decrypted.bin | grep Hello
Hello from SEC boot K1 & FE !
```
- Respect the bytes order in binary file

```
limited@linux:~/esp/bin_decrypt_dump$ hexdump -C my_dumped_fek.bin
00000000  38 c8 75 e3 33 76 41 15  f9 5f 65 43 dd f2 e9 2c  |8.u.3vA.._eC...,|
00000010  78 1f a0 42 53 bf 14 8f  ce 68 9f 00 86 55 52 9b  |x..BS....h...UR.|
```

FATAL Exploit step 2: Sign Your Code

- Firmware is now decrypted
- dd ivt.bin (the first 128 random bytes at 0x00 in decrypted.bin)
- dd Bootloader.bin at 0x1000
- Confirm the true SBK
 - digest computation command
- Write your Code
 - a little FW backdoor maybe? ☺
- Compile images
 - using FEK and SBK
- Flash new FW

```
limited@linux:~/esp/bin_decrypt_dump$ hexdump -C -n 192 decrypted.bin

OTP/EFuses FATAL Conclusion

- FATAL exploit leading to SBK and FEK extraction
 - Breaking Secure Boot and Flash Encryption
- An attacker can decrypt the Firmware (and access sensitive data)
- An attacker can sign & run his own (encrypted) code PERSISTENTLY
- Low Cost, Low Complexity
- Easy to reproduce
- No Way to fix
- All ESP32 versions vulnerable

Vendor Reaction

- Resp. disclosure
 - PoC sent on July 24
 - CVE-2019-17391 (req. by Vendor)
 - Posted on November 13
- Security Advisory on November 1 [7]

The ESP32-D0WD-V3 chip has checks in ROM which prevent fault injection attack. This chip and related modules will be available in Q4 2019. More information about ESP32-D0WD-V3 will be released soon.

- No way to Fix but...you can buy the next version ☺
- Millions of vulnerable Devices on the field for the coming years

The impact

- For Hobbyists
 - Don't worry, your 'connected DIY device' is safe ☺
- For Developers
 - In case you are using the ESP32 security features to protect SECRETS, you should be worried...
 - FYI, I identified 3 companies using ESP32 Flash Enc. and Sec.Boot in their products to protect their 'business model'
- For the vendor
 - Force to modify silicon to save his longevity commitment and his reputation
 - What about current devices offered for sales?

Final Conclusion

- Attacker with physical access can compromise ESP32 security badly
 - PERSISTENT Bypass of Secure Boot + Flash Encryption
- Fix?
 - No fix on current ESP32 version
- Platform is broken
 - A new chip version will be released
- General Message for Vendors
 - Don't patch silently
- New Results coming soon, stay tuned!
